cutting edge therapy mansfield: Cutting Edge Therapies for Cancer in the 21st Century

Pier Paolo Claudio, Paraskevi Vogiatzi, 2014-04-23 Cancer is a broad group of diseases involving unregulated cell growth with elevated death rates as more people live in old age with mass lifestyle changes occurring in the world. The causes of cancer are diverse, complex, and still only partially understood. The chances of surviving the disease vary remarkably by the type and location of the malignancy and the extent of disease at the start of treatment. Early cancer detection is proving to be a valid approach. Cancer can be detected in a number of ways, including the presence of certain signs and symptoms, screening tests, or medical imaging. Cancer therapy is dynamically changing and revision and change in patient management is constant as our knowledge increases. Cancer is routinely treated with chemotherapy, radiation therapy and surgery. Tailored cancer targeted therapy is becoming an emerging objective of today. In this book, a constructive group of cancer research experts bring the reader their shared vision, to give an extensive and realistic view of individual tumors such as breast, oral, prostate, gastric, and neuroendocrine tumors. New and contemporary terms and concepts in genetics and epigenetics, diet, anticancer treatments, and anticancer drug delivery systems are introduced in this volume. This reference highlights present experimental strategies and key findings that enhance our understanding of cancer and of future therapies. This eBook is aimed at a broad audience of undergraduates, medical students, PhDs, cancer researchers, and also cancer patient families with the goal to conceive a curiosity about the subjects presented that will hopefully lead to further studies.

cutting edge therapy mansfield: Advancements and Cutting-Edge Approaches to Counteract the Inefficacy of Immune Checkpoint Inhibitor Therapies in Lung Cancer

Guangchun Han, Guangsheng Pei, Ziheng Wang, 2025-04-29 Lung cancer is among the cancers with the highest incidence in the world, of which about 80% of patients are non-small cell lung cancer, mainly because there are no obvious symptoms at an early stage, usually diagnosed at a clinically advanced stage, and the prognosis is extremely poor. Surgery, radiotherapy, chemotherapy, and targeted therapy are the traditional treatment methods for lung cancer, which cannot fully meet the needs of clinical treatment. In recent years, immunotherapy has become the focus of lung cancer treatment. The immune checkpoint is a kind of immunosuppressive molecule that can regulate the body's immune activation. The abnormal expression and function of the immune checkpoint is one of the important causes of lung cancer. Therefore, repairing immune checkpoint abnormalities has become an important option for cancer treatment. Programmed death receptor 1 (PD-1), programmed death ligand 1 (PD-L1), and T cell mucin immunoglobulin 3 (TIM-3) are common checkpoints of the immune system. In recent years, the application of immune checkpoint inhibitors (ICIs) in lung cancer has made great progress, which has brought long-term survival benefits to some lung cancer patients. However, some patients who received ICIs had no effect or transient benefit, suggesting the existence of primary and secondary immune resistance. The mechanism of immunotherapy resistance is very complex, and how to overcome drug resistance and find new therapeutic targets is an important problem. At present, combination therapies are used to delay or prevent the development of resistance to immune checkpoint inhibitors (ICI), including blocking immunosuppressive signals, activating stimulatory signals, regulating the immune microenvironment, and targeting T cells. It is promising to specify different therapies to treat lung cancer according to different biological resistance mechanisms. Therefore, further research is still

needed to better integrate immune checkpoint inhibitors with the treatment of lung cancer, optimize the current treatment methods of lung cancer, and improve clinical outcomes.

cutting edge therapy mansfield: *Imaging in Photodynamic Therapy* Michael R. Hamblin, Yingying Huang, 2017-02-03 This book covers the broad field of cellular, molecular, preclinical, and clinical imaging either associated with or combined with photodynamic therapy (PDT). It showcases how this approach is used clinically for cancer, infections, and diseases characterized by unwanted tissue such as atherosclerosis or blindness. Because the photosensitizers are also fluorescent, the book also addresses various imaging systems such as confocal microscopy and small animal imaging systems, and highlights how they have been used to follow and optimize treatment, and to answer important mechanistic questions. Chapters also discuss how imaging has made important contributions to clinical outcomes in skin, bladder, and brain cancers, as well as in the development of theranostic agents for detection and treatment of disease. This book provides a resource for physicians and research scientists in cell biology, microscopy, optics, molecular imaging, oncology, and drug discovery.

cutting edge therapy mansfield: Depression, An Issue of Psychiatric Clinics David Mintz, 2012-03-28 This issue discusses the diagnosis and treatment of major depressive disorder (MDD) and other depressive disorders, with an emphasis on the psychosocial aspects of depression: how it affects societies, how it is affected by culture, and what the true meaning of recovery is for those suffering from MDD. The issue is divided into three sections: Etiology, Diagnosis and Treatment. Authors address the evidence where biology and subjectivity meet. They discuss what is adaptive and what is pathologic and discuss population-based solutions that take into account the specificity of the individual. Authors also take into account combination treatments of psychotherapy and pharmacotherapy and weigh the treatment choices against specific patient subtypes.

cutting edge therapy mansfield: Ethics in Pharmacy Practice: A Practical Guide Dennis M. Sullivan, Douglas C. Anderson, Justin W. Cole, 2021-06-16 This textbook offers a unique and accessible approach to ethical decision-making for practicing pharmacists and student pharmacists. Unlike other texts, it gives clear guidance based on the fundamental principles of moral philosophy, explaining them in simple language and illustrating them with abundant clinical examples and case studies. The strength of this text is in its emphasis on normative ethics and critical thinking, and that there is truly a best answer in the vast majority of cases, no matter how complex. The authors place high trust in a pharmacist’s moral judgment. This teaches the reader how to think, based on ethical principles, not necessarily what to think. This means navigating between the two extremes of overly theoretical and excessively prescriptive. The cogent framework given in this text uses the language of competing duties, identifying the moral principles at stake that create duties for the pharmacist. This is the balancing act of normative ethics, and of deciding which duties should prevail in a given clinical situation. This work presents a clear-cut pathway for resolving ethical dilemmas encountered by pharmacists, based on foundational principles and critical thinking. cutting edge therapy mansfield: *CAR-T Cell Therapies for Non-Hematopoietic Malignancies: Taking Off The Training Wheels* Avery Dexter Posey, Jr., John - Maher, Marcela V. Maus, 2020-04-24 Chimeric antigen receptor (CAR) T cell therapies for leukemia (e.g.

tisagenlecleucel) and lymphoma (e.g. axicabtagene ciloleucel) have recently received regulatory approval in the United States. Phase I/II trials have demonstrated complete remission of refractory or relapsed tumors in 50% - 94% patients. However, the clinical successes of engineered T cells for the treatment of solid malignancies have thus far been few and far between. Furthermore, several instances of severe and lethal toxicities have arisen due to on-target, off-tumor recognition of antigen by T cell products. Recent advances in phase I trials for solid tumors, as well as in pre-clinical models, have revealed several variables that will be important to consider for the successful use of CAR-T cells in treating solid tumors. These variables include (i) regional versus systemic delivery; (ii) scFv versus ligand interactions; (iii) antigen loss versus escape; (iv) epitope spreading and (v) checkpoint expression on immune cells or tumor cells. Also, there remains outstanding mechanistic questions related to why differences exist in the persistence and tonic signaling of second-generation CD28 versus 4-1BB co-stimulated CAR-T cells. In addition, we are now learning the roles of lympho-depleting regimens (and associated toxicities) in modifying the persistence of engineered T cell therapies. A more comprehensive view of CAR-T cell strategies and important advances, both of pre-clinical and clinical evaluations, in solid tumors is necessary to drive these therapies forward.
