Understanding the *Frontiers in Nutrition* Impact Factor

The *Frontiers in Nutrition* impact factor is a quantitative metric that reflects the average number of citations received by articles published in the journal over a specific period, typically two years. It serves as an indicator of the journal's influence and prominence in the field of nutrition science. This metric helps authors identify reputable journals for submitting their research and assists institutions in assessing the quality of publications. *Frontiers in Nutrition* is an open-access, peer-reviewed journal that covers a wide range of topics related to human nutrition, including clinical nutrition, nutritional epidemiology, and metabolic studies.

Definition and Purpose

The impact factor measures the frequency with which the "average article" in a journal has been cited in a particular year. It is widely used to gauge the journal's scholarly impact and its role in advancing nutrition knowledge. A higher impact factor generally signals a more influential journal, attracting high-quality submissions and readership.

Historical Context of Frontiers in Nutrition

Since its establishment, Frontiers in Nutrition has steadily grown in reputation due to its rigorous peer-review process and commitment to publishing cutting-edge research. The journal's impact factor has evolved, reflecting its increasing citation rates and expanding scientific contributions.

Calculation Methodology of Impact Factor

The impact factor calculation is standardized and performed annually by organizations such as Clarivate Analytics through their Journal Citation Reports. It involves a specific formula that considers citations over a defined timeframe, ensuring comparability across journals and disciplines.

Formula for Impact Factor

The impact factor for a given year is calculated as follows:

1. The numerator is the total number of citations in that year to articles published in the journal during the previous two years.
2. The denominator is the total number of "citable items" published in the journal during those two preceding years.

This ratio yields the average citations per article, representing the impact factor.

Types of Citable Items

Citable items typically include research articles, reviews, and proceedings papers. Editorials, letters, and news items are usually excluded from the denominator. The classification of items can influence the impact factor and varies slightly among journals.

frontiers in nutrition impact factor: Buffalo (Bubalus bubalis) Meat Manish Kumar Chatli, **frontiers in nutrition impact factor: Red and processed meat in the context of health and the environment** World Health Organization, 2023-07-10 There is growing international consensus that food systems transformation is important to address the challenges of malnutrition in all its forms, the burden of noncommunicable diseases (NCDs), environmental sustainability, increasing inequality and ensuring the welfare of workers and animals. In light of the urgency of these challenges, there are questions about the role of red and processed meat in healthy and sustainable food systems. Globally, production and consumption of all types of meat has increased substantially in the last 50 years, and - although red meat consumption is now plateauing in high-income countries (HICs) - is predicted to increase by a further 50% by 2050. Meat consumption remains highly unequal both between and within countries, and animal-source food intakes, including red meat, are lowest among those at most risk of undernutrition. This information brief synthesizes the evidence on the role of red and processed meat production and consumption in health and environmental outcomes, and in different social and political contexts. It does not give consumption recommendations, but, rather, represents the first stage in a scoping process that could lead to World Health Organization (WHO) guidance on the role of red and processed meat in healthy diets from sustainable food systems. This information brief may also be used to inform the development of commitments and policy action on climate change and food systems at the 28th Conference of the Parties of the United Nations Framework Convention on Climate Change (COP28) in late 2023 and beyond.

frontiers in nutrition impact factor: Animal Models, Gut Microbiota and Brain Diseases Yu Wang, Jin Song, Niraj Kumar Jha, Kavindra Kumar Kesari, Chang Liu, 2025-09-11 Brain diseases are among the major disorders influencing human health. In general, brain diseases include diseases that might be classified as neurological or psychiatric, for example, Alzheimer's disease, Parkinson's disease, epilepsy, depression, autism, and addiction. Patients with these types of diseases are mainly characterized by abnormal thinking patterns, cognition, emotional states, and behavior. To date, much of the research on these diseases has used animal models. Despite some encouraging findings, the underlying pathophysiology of these diseases is still relatively unclear. In particular, whether some findings are causal, accompanying, or simply irrelevant to the occurrence of brain diseases has great significance for the development of more effective treatments. In this respect, there is a recognized need for more updated perspectives from preclinical investigations in animal models. It is worth mentioning that since it was first reported in 2011, the reduction of anxiety-like behavior and the changes of neurochemicals in the brain were observed in mice with the absence of gut microbes, resulting in a surge of interest in the role of the gut microbiota in health. And the new concept of microbiota-gut-brain (MGB) axis was formally put forward in 2012, which revealed the ways in which peripheral systems and organs affect the brain, and showed that the periphery and the center can be closely linked through the carriers of gut microbiota. After more than a decade of development, animal models provide an important vehicle for exploring the role of gut microbiota in

the pathology of brain diseases, potential therapeutic approaches and diagnostic tools. However, extending these findings to the diagnosis and treatment of human brain diseases still faces great challenges.
