preschool math activities for summer: *Supporting Children's Well-Being During Early Childhood Transition to School* Tatalović Vorkapić, Sanja, LoCasale-Crouch, Jennifer, 2020-10-23 Life transitions differ concerning the intensity of the change and the intensity of the child's reaction to that change. For most children, the first and most significant transition is from the family home to an institution of early care and education, which includes preschool. These transitions can also include children's passage from kindergarten to elementary school. However, the intensity of the child's reaction is related to the size of the change that is happening and also to who or what is involved in that change and the importance a child attributes to that someone or something. *Supporting Children's Well-Being During Early Childhood Transition to School* is an essential scholarly publication that examines evidence-based practices and approaches that fully support a child's well-being during transition periods in early childhood. It serves as a resource to rethink contemporary transition theoretical models, research studies, and applied practices. Featuring a wide range of topics such as emotional competency, language learners, and professional development, this book is ideal for academicians, psychologists, early childhood educators, daycare centers, curriculum designers, policymakers, researchers, education professionals, and students.

preschool math activities for summer: Engaging Families as Children's First

Mathematics Educators Sivan Phillips, Ann Gervasoni, Peter Sullivan, 2016-11-21 This book explores how professionals can engage and inspire parents to support their young children's mathematics learning. Bringing together international experts, researchers and scholars, it proposes a framework for engaging with and supporting parents, including those who are less aware of the crucial development of children's mathematical skills in the early years. Focusing on mathematics learning from birth to 5 years, the book's underlying assumption is that it is possible to offer guidance to professionals working with families with young children concerning how to engage and support families in the area of mathematics learning, including those families who seem alienated from education services. Specifically, the respective chapters present a framework for understanding children's early mathematical development and the important role of families in this regard. They describe effective strategies for engaging families in their children's mathematics learning, including those who are marginalised and experience multiple disadvantages, so that all families can best support their children's mathematical learning and their development of positive attitudes towards learning. In closing, hurdles and opportunities within the systems surrounding family engagement are addressed.

preschool math activities for summer: Contemporary Perspectives on Research in Motivation in Early Childhood Education Olivia Saracho, 2019-03-01 Researchers from different disciplines (e.g., physiological, psychological, philosophical) have investigated motivation using multiple approaches. For example, in physiology (the scientific study of the normal function in living systems such as biology), researchers may use “electrical and chemical stimulation of the brain, the recording of electrical brain-wave activity with the electroencephalograph, and lesion techniques, where a portion of the brain (usually of a laboratory animal) is destroyed and subsequent changes in motivation are noted” (Petri & Cofer, 2017). Physiological studies mainly conducted with animals, other than humans, have revealed the significance of particular brain structures in the control of fundamental motives such as hunger, thirst, sex, aggression, and fear. In psychology, researchers may study the individuals’ behaviors to understand their actions. In sociology, researchers may examine how individuals’ interactions influence their behavior. For instance, in the classroom students and teachers behave in expected ways, which may differ when they are outside the classroom. Saracho (2003) examined the students’ academic achievement when they matched or mismatched their teachers’ way of thinking. She identified both the teachers and students individual differences and defined consistencies in their cognitive processes. In philosophy, researchers can study the individuals’ theoretical position such as supporting Maslow’s (1943) concept that motivation can create behaviors that augments motivation in the future. Abraham H. Maslow’s theory of self-actualization supports this theoretical position (Petri & Cofer, 2017). These areas and others are represented in this volume. This volume is devoted to understanding mutual and contemporary themes in the individuals’ motivation and its relationship to cognition. The current literature covers several methods to the multifaceted relationships between motivational and cognitive processes. Comprehensive reviews of the literature focus on prominent cognitive perspectives on motivation with young children, which includes ages from birth to eight years of

age. The chapters in this special volume review and critically analyze the literature on several aspects of the relationships between motivational and cognitive processes and demonstrates the breadth and theoretical effectiveness of this domain. This brief introduction acknowledges the valuable contributions of these chapters to the study of human motivation. This volume can be a valuable tool to researchers who are conducting studies in the motivation field. It focuses on important contemporary issues on motivation in early childhood education (ages 0 to 8) to provide the information necessary to make judgments about these issues. It also motivates and guides researchers to explore gaps in the motivation literature.
