who does d2 management collect for: Investigation and Management of Disease in Wild Animals G.A. Wobeser, 2013-04-17 - A hypothesis is a proposition, set forth as an explanation for the occurrence of a phenomenon, that can be tested. - The basis for scientific investigation is the collection of information to formulate and test hypotheses. - Experimental methods measure the effect of manipulations caused by the investigator; observational methods collect information about naturally occurring events. - There are three sub-types of experimental techniques that differ in the way subjects are chosen for inclusion in the study, in the amount of control that the investigator has over variables, and in the method used to assess changes in other variables. - Descriptive observational studies dominate the early phase of most investigations and involve the description of disease-related events in the population. Associations among factors may be observed but the strength of the associations is not measured. - Analytical observational techniques are of three basic types: prevalence surveys, case:control studies, and incidence or cohort studies. All attempt to explain the nature of relationships among various factors and to measure the strength of associations. - Prevalence surveys and case:control studies deal with disease existing at the time of the study; incidence studies are concerned with the development of disease over time. - Observational studies may be retrospective, using existing data, or prospective with collection of new information.

who does d2 management collect for: Challenges for Next Generation Network Operations and Service Management Yan Ma, Deokjai Choi, Shingo Ata, 2008-10-16 We are delighted to present the proceedings of the 11 Asia-Paci?c Network Operations and Management Symposium (APNOMS 2008) which was held in Beijing, China, during October 22-24, 2008. The Organizing Committee (OC) selected the theme of this year's symposium as "Challenges for Next-Generation Network Operations and Service Management." Research and development on next-generation networks (NGNs) have been carried out over the last few years and we are already seeing their deployment and operations in many parts of Asia-Paci?c countries. We are also beginning to experience new and interesting services that utilize these NGNs. We are certain that we will see more deployment of NGNs and NGN services in the next few years. Thus, the operations and management of NGNs and their services are very important to the network operators and service providers. At the same time, they are also concerned about new and more effective ways of performing the operations and management. This year, the APNOMS call for papers received 195 paper submissions from 19 different countries, including countries outside the Asia-Paci?c region (Europe, Middle-East, North and South America). Each paper was carefully reviewed by at least three international experts. Based on review scores, the APNOMS 2008 Technical Program Committee discussed the selection of papers, and selected 43 high-quality papers (22.1% of submissions) as full papers and 34 papers as short papers. Accepted papers were arranged into ten technical sessions and two short paper sessions (poster presentation).

who does d2 management collect for: Strategic Management and Sustainability Transitions Michael Zhang, 2023-12-01 The subject of sustainability transitions has, in the past decade or so, become an established research field for academics, policy makers and practitioners alike. Conceptual and theoretical developments in the field have gradually advanced from the perspectives of socio-technical systems and business models. Scholars contend that it is the interactions of the networks of actors, technologies, and institutions that drive transition processes toward sustainability. In this volume we further advance this line of inquiry with a special reference to

strategic management of sustainability transitions, in both theory and practice. In theoretical development, we have selected three chapters to encompass the themes of (1) the interactions between ecological systems and human systems; (2) a critique on the continuous expansion of large multinational companies and their strategic control of key resource inputs through the lenses of circular economy and natural resource-based view; and (3) a multi-stakeholder ecosystems framework for the management of sustainability transitions with structural alignment of focal value propositions. The United Nations' Sustainable Development Goals (SDGs) are critically addressed and empirically examined. It will become an essential reader and a reference book for researchers and postgraduate students interested in strategic management, international business, innovation studies, consumer behavior, and public administration.

who does d2 management collect for: Supply Chain Management and Transport

Logistics John J Liu, 2011-09-08 The enterprise-focused framework of supply chain, which an overwhelming majority of books on supply chain management (SCM) have adopted, falls short in explaining recent developments in the real world, especially the so-called Wal-Mart model, in which a 'factory' is a virtual logistics network of multiple international manufacturing firms. The book fills the gap and examines supply chain and transport logistics. The book also includes the development of a unified methodological framework which underpins all the characteristics of the interrelationship between supply chain management and logistics. It covers many aspects of the important and innovative developments well. The book offers a unique coverage of integrated logistics of navigation, aviation and transportation. The book not only answers the urgent need for a book on supply chain management and transport logistics but also highlights the central role of supply chain logistics in the emerging fields of sustainable (green), humanitarian and maritime supply chains and the importance of studying supply chain management together with transport logistics. It also explains the difference between supply chain logistics and manufacturing logistics. It is a useful reference for those in the industry as well as for those taking related courses.

who does d2 management collect for: Statsnotes: Some Statistics For Management Problems

Alan Jessop, 2016-03-17 Managers need access to some statistical advice from time to time to help in solving business problems. Students need access to statistical methods to support work in non-statistics courses, case studies and projects. What is needed will depend on the demands of the problem and how much statistics the manager or student already knows. The requirement is for flexible decision support. This unique book presents statistical ideas and models in easily accessible form describing both methods and issues of application. statsNotes are organized as a set of over one hundred notes rather than as a number of chapters. This enables managers and students to locate just what they need for the problem they have. Each note consists of a description of what to do, an example, the rationale, links to other notes. Managers and students can choose to use as many notes as necessary, which might be just one note or a set of linked notes. Deciding which method will be helpful depends not just on finding an appropriate statistical method but on the business context too. statsNotes provide advice at three levels: While the range of topics covered is similar to those in introductory textbooks and courses, the focus is on management decision and the methods for dealing with risky decisions and management judgment in this book are usually found in more specialist texts.
